

Innovation and Industry Applications of Artificial Intelligence

Transforming the Future, One Algorithm at a Time

PRESENTER : RADHIKA S

DATE : 20/05/2026

60-MIN SESSION

Made with GAMMA

Roadmap for Today

In the next hour, we move past the buzzwords and explore how AI is actively reshaping industries you may soon work in.

01

Demystifying AI

What it really is — separating fact from fiction

02

The Innovation Wave

Generative AI and the technologies leading the charge

03

AI in Action

Real applications across Healthcare, Finance, Retail & more

04

The Future

Ethics, risks, and emerging career opportunities

05

Open Floor

Q&A and open discussion

More Than Just Sci-Fi

AI is not magic — it's **math, data, and pattern recognition**. At its core, it simulates human intelligence in machines programmed to think, learn, and act.

The Core Goal

AI is not designed to *replace* humans — it's built to **augment human capabilities**, handling repetitive or complex tasks so people can focus on higher-order thinking.

- 📘 Teaching a computer to recognize patterns is the foundation of nearly every AI application in use today.

From "Reactive" to "Generative"

AI has evolved dramatically — from systems that follow rigid rules to ones that **create entirely new content** on demand.

Traditional AI

Rule-based, reactive systems. Does one thing well.

- Chess engines & game bots
- Spam filters
- Basic recommendation rules

Generative AI

Creates *new* content from learned patterns.

- ChatGPT — Text generation
- Midjourney / DALL-E — Images
- Sora — AI-generated video

Computer Vision

AI that can "see" and interpret visual data.

- Self-driving cars
- Face ID & biometrics

NLP

AI that understands human language & emotion.

- Sentiment analysis
- Real-time translation

AI in Healthcare: Saving Lives

Diagnostics

AI detects cancer in X-rays and MRIs faster and more accurately than human radiologists, catching early-stage indicators that are easy to miss.

Drug Discovery

AI simulates molecular interactions to identify promising compounds — compressing years of lab work into days. Google's DeepMind AlphaFold cracked protein folding.

Personalized Medicine

Treatments tailored to a patient's unique genetic profile, improving outcomes and reducing side effects across oncology and chronic disease management.

AI in Finance: The Smart Money

Fraud Detection

Banks flag unusual spending patterns in **milliseconds**, stopping fraud before it clears.

Algorithmic Trading

High-frequency AI executes trades based on real-time market signals faster than any human.

Customer Service

AI chatbots now handle **80% of routine banking queries** around the clock.

Inclusive Credit Scoring

Alternative data (e.g., utility payments) extends loan access to **unbanked populations**.

AI in Retail & Manufacturing

Retail & E-Commerce

- **Recommendation Engines** — "Because you watched this..." drives **30%+ of revenue** for Amazon and Netflix.
- **Supply Chain Optimization** — Predicts exact stock levels, cutting overstock and waste.
- **Cashier-less Tech** — Amazon Go stores let customers grab items and walk out, billed automatically.

Manufacturing & Industry 4.0

- **Predictive Maintenance** — Sensors detect machine failure *before* it happens, saving millions in downtime.
- **Quality Control** — Computer vision cameras spot assembly-line defects faster than any human eye.
- **Digital Twins** — Virtual factory replicas let engineers test changes safely before physical implementation.

AI on the Move — and in the Studio

Transportation & Logistics

Tesla and Waymo lead autonomous vehicle development. UPS uses real-time route optimization to cut millions of miles annually. Smart traffic lights adapt to live traffic flow.

Creative & Marketing

AI writes blogs, generates ad copy, and targets audiences with surgical precision. Deepfake and avatar synthesis open new doors — and **serious ethical questions** — in entertainment and customer experience.

Navigating the Risks

With great power comes great responsibility. The path to beneficial AI requires confronting its real challenges head-on.

Bias in AI

Biased training data produces biased outcomes — hiring algorithms have already discriminated by race and gender.

Jobs: Lost & Gained

Routine roles will be displaced, but new careers — Prompt Engineering, AI Ethics, MLOps — are already emerging.

Privacy

AI systems consume vast amounts of personal data. Regulatory frameworks like GDPR are only the beginning.

The Black Box

Many AI decisions are unexplainable — a critical problem in healthcare, law, and finance where accountability matters.

 The horizon: **AGI (Artificial General Intelligence)** — AI that can perform any intellectual task a human can. Still theoretical, but the conversation has begun.

Key Takeaways & Discussion

AI is a Tool, Not Magic

It runs on data, math, and well-defined objectives — not intuition.

Generative AI is the New Frontier

The shift from analytical to generative AI is redefining what's possible.

Every Industry is Being Reshaped

Healthcare, Finance, Retail, Manufacturing — no sector is untouched.

Humans Remain in the Loop

We guide, govern, and give purpose to AI — that role is irreplaceable.

Thank You!
